

A**The same curve in an independent cohort**

Breadth of action, defined in UK Biobank

femoral neck, shared layer vs all other genes $P = 4 \times 10^{-39}$ breadth holds beside all six UK Biobank site scores: $t = 11.5$ **B****And it carries fracture risk**

Breadth of action (number of skeletal sites)

breadth holds beside all six site scores: $t = 11.2$, $P = 3 \times 10^{-29}$ **C****Only the shared layer travels** $n = 103, 36$ and $18,245$ genes
